Chapter roadmap

Packet Networks

Link Layer

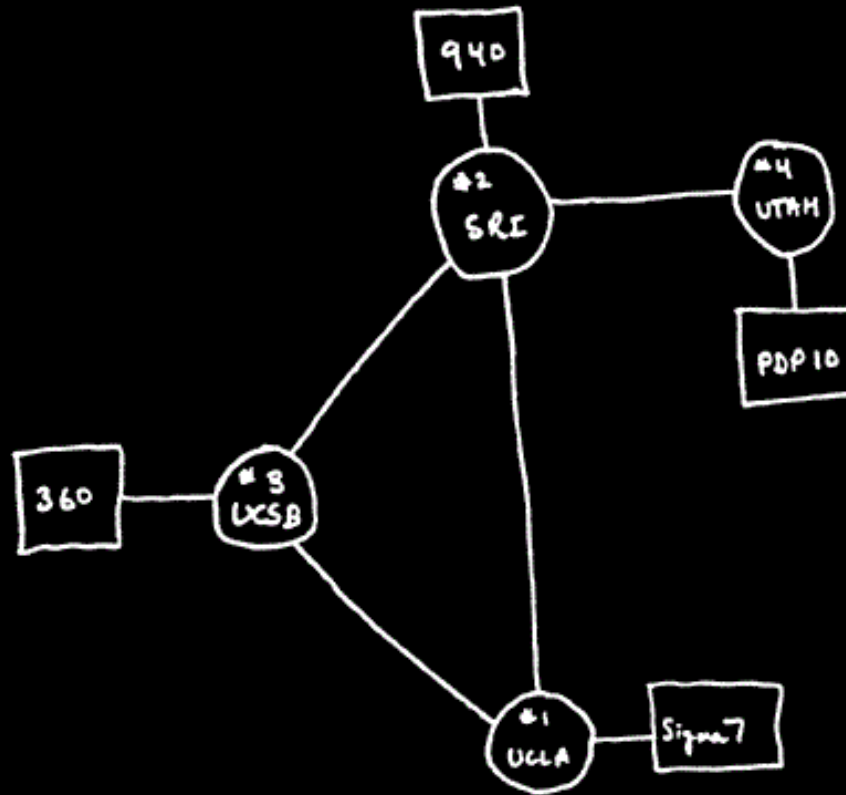

Internet Protocol

The Internet

Delay, loss and throughput in packet-switched networks

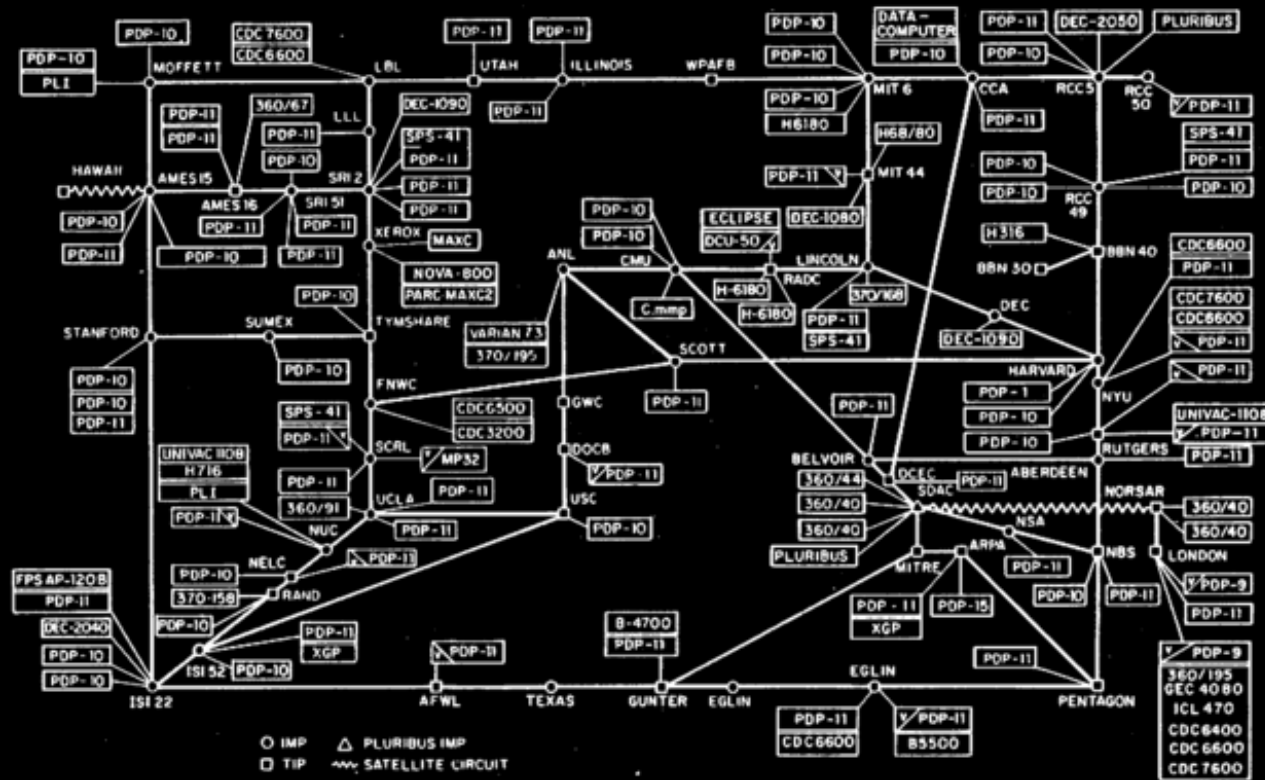

ARPANET, 1969.

ARPANET, 1977.

ARPANET LOGICAL MAP, MARCH 1977

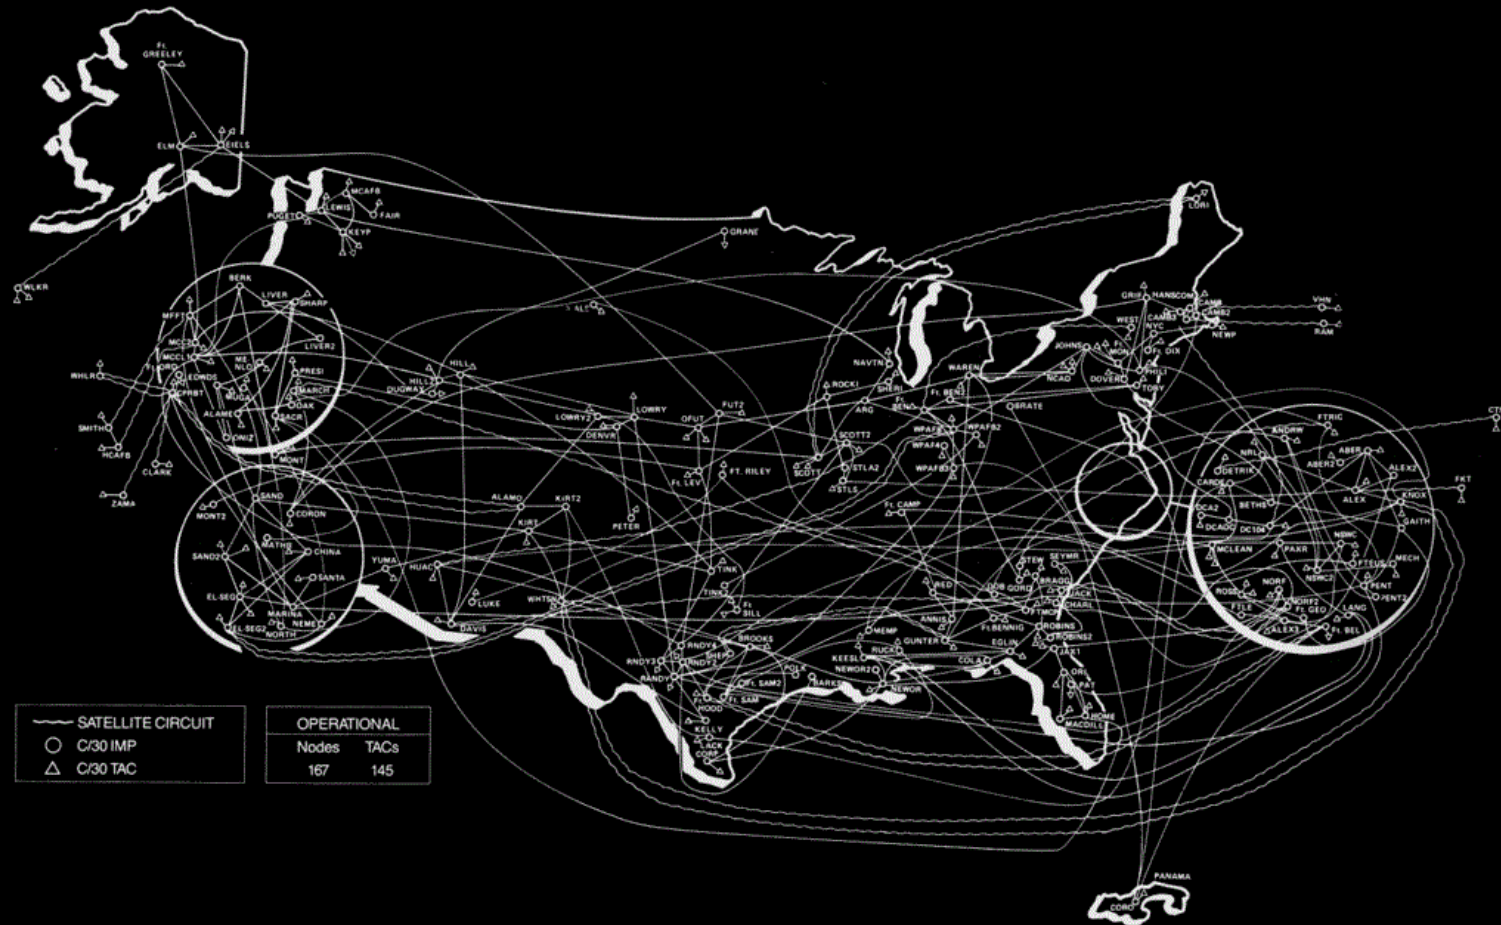

(PLEASE NOTE THAT WHILE THIS MAP SHOWS THE HOST POPULATION OF THE NETWORK ACCORDING TO THE BEST INFORMATION OBTAINABLE, NO CLAIM CAN BE MADE FOR ITS ACCURACY)

NAMES SHOWN ARE IMP NAMES, NOT (NECESSARILY) HOST NAMES

Internet Structure

MILNET, 1983.

INTERNET, Today.

“Cool” internet appliances

IP picture frame
<http://www.ceiva.com/>
Free invitations for guests to send photos

Web-enabled toaster +
weather forecaster

World's smallest web server
in 1999

Internet phones

⇒ Who knows other cool internet appliances?

What's the Internet: "nuts and bolts" view

-  PC
-  server
-  wireless laptop
-  cellular handheld

□ millions of connected computing devices:
hosts = end systems

- running *network apps*

□ *communication links*

access points

wired links

- fiber, copper, radio, satellite

- transmission rate = *bandwidth*

router

□ *routers*: forward packets (chunks of data)

What's the Internet: "Nuts and Bolts" view

- ❑ **Protocols** control sending, receiving of messages
 - e.g., TCP, IP, HTTP, Skype, Ethernet
- ❑ **Internet: "network of networks"**
 - loosely hierarchical
 - public Internet versus private intranet
- ❑ **Internet standards**
 - RFC: Request for comments
 - IETF: Internet Engineering Task Force
 - IANA: Internet Assigned Numbers Authority
- ❑ **Communication infrastructure** enables distributed applications:
 - Web, VoIP, email, games, e-commerce, file sharing
- ❑ **Communication services provided to applications:**
 - reliable data delivery from source to destination
 - "best effort" (unreliable) data delivery

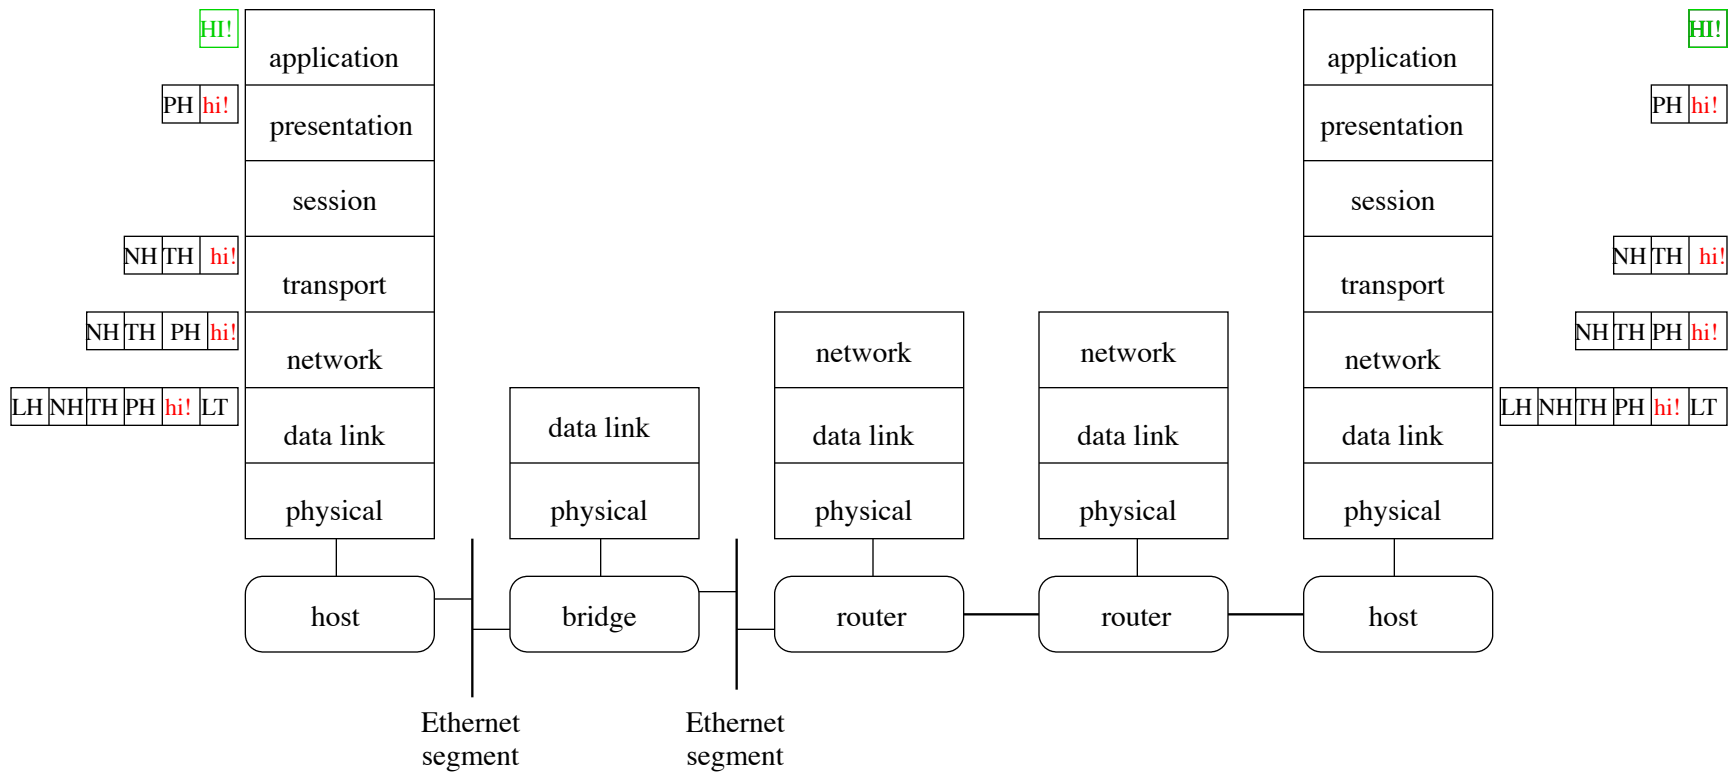

Protocol Mechanisms

- All or some of the following:
 - addressing/naming: manage identifiers
 - fragmentation: divide large message into smaller chunks to fit lower layer
 - re-sequencing: reorder out-of-sequence messages
 - error control: detection and correction of errors and losses
 - retransmission; forward error correction
 - flow control: avoid flooding/overwhelming of slower receiver
 - congestion control: avoid flooding of slower network nodes/links
 - resource allocation: administer bandwidth, buffers among contenders
 - multiplexing: combine several higher-layer sessions into one “channel”
 - compression: reduce data rate by encoding
 - privacy, authentication: security policy (others are listening)

Protocol Layering

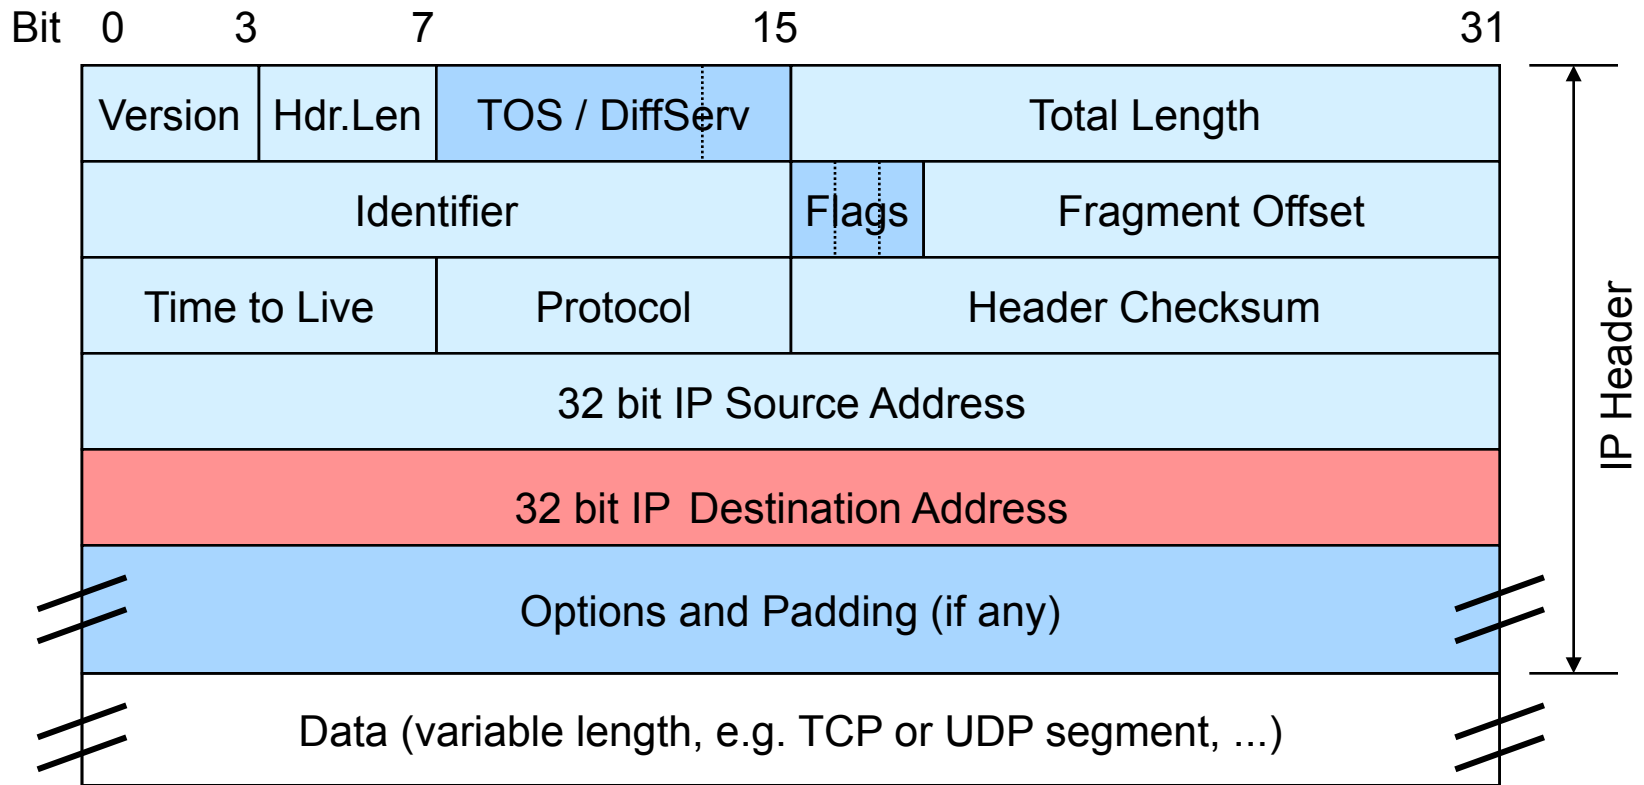

□ **send side** layer N takes protocol data (PDU) from layer N + 1, adds header, and passed to N-1

□ **receive side** layer N takes PDU from N -, strips N headers, processes and passes rest to N + 1

IPv4 Datagram

Ethernet Frame Structure

- Sending adapter encapsulates IP datagram (or other network layer protocol packet) in **Ethernet frame**

PR 56 bit	SFD (8 bit)	DA (16/48 bit)	SA (16/48 bit)	Type/Len (16 bit)	Data (≤12.000 bit)	PAD (0-368 bit)	FCS (32 bit)
--------------	----------------	-------------------	-------------------	----------------------	-----------------------	--------------------	-----------------

PR Preamble (1010101010...)

SFD *Start-of-frame Delimiter* (10101011)

DA *Destination Address*

SA *Source Address*

Type Protocol type of payload (e.g. IP, ARP, ...) - in Ethernet II frame format

Len Length of payload in Byte - in Ethernet I and IEEE 802.3 frame format

Data Data

PAD *Padding (if data length is less than 46 byte)*

FCS *Frame Check Sequence: CRC32*

Layering Considered Harmful?

- Benefits of layering
 - need layers to manage complexity
 - don't want to reinvent Ethernet-specific protocol for each application
 - common functionality
 - “ideal” network
- but:
 - layer N may duplicate lower layer functionality (error recovery)
 - different layers may need same information
 - layer N may need to peek into layer N+x

Link Layer

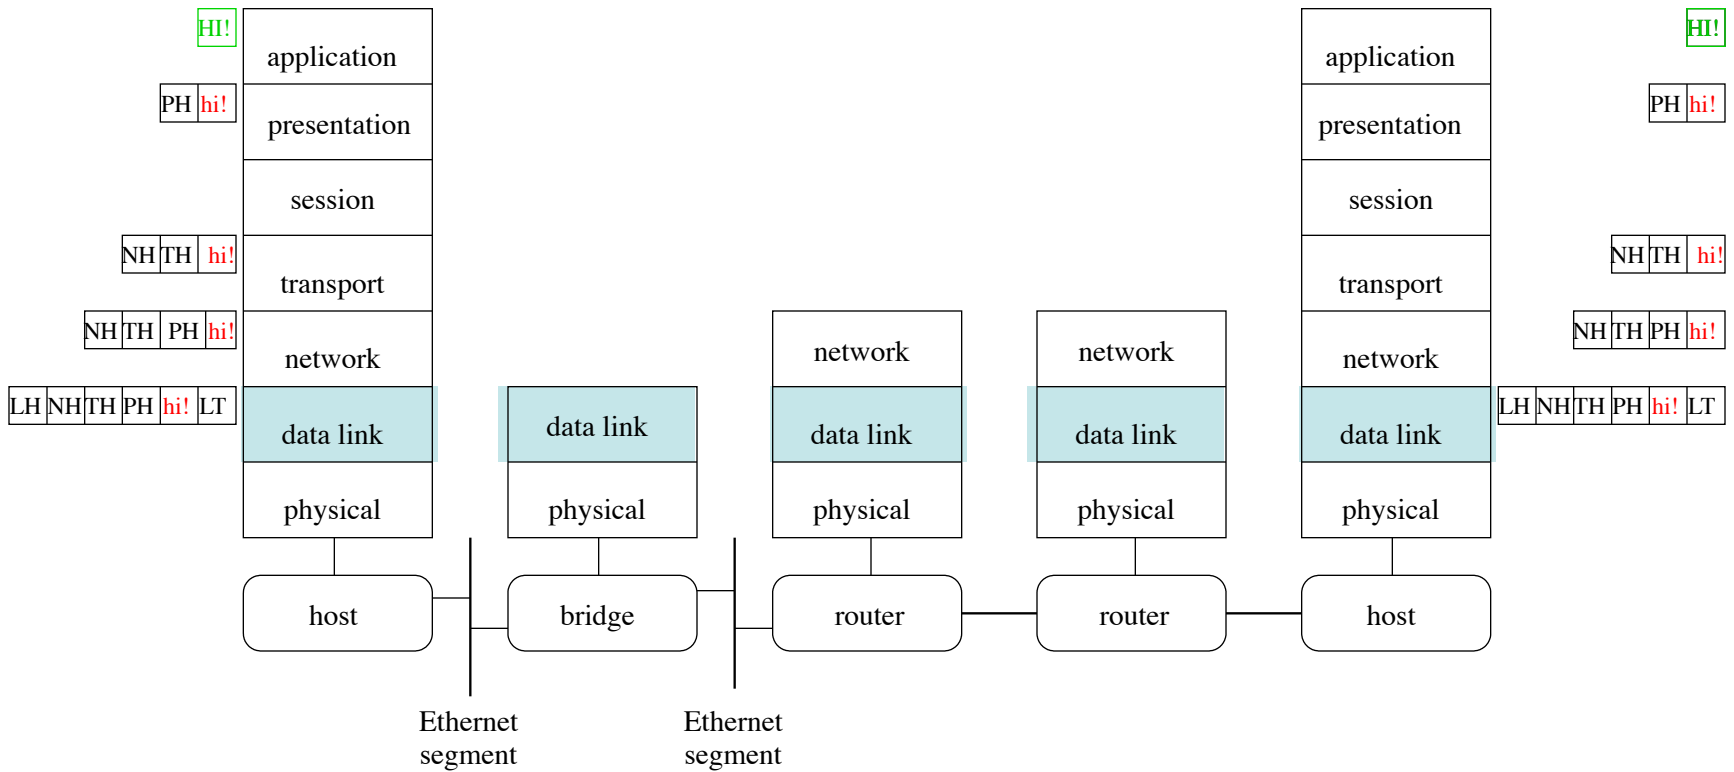

Our goals:

- ❑ understand principles behind data link layer services:
 - error detection, correction
 - sharing a broadcast channel: multiple access
 - link layer addressing
 - reliable data transfer, flow control: *c.f. transport layer*
- ❑ instantiation and implementation of various link layer technologies

Protocol Layering

Link Layer

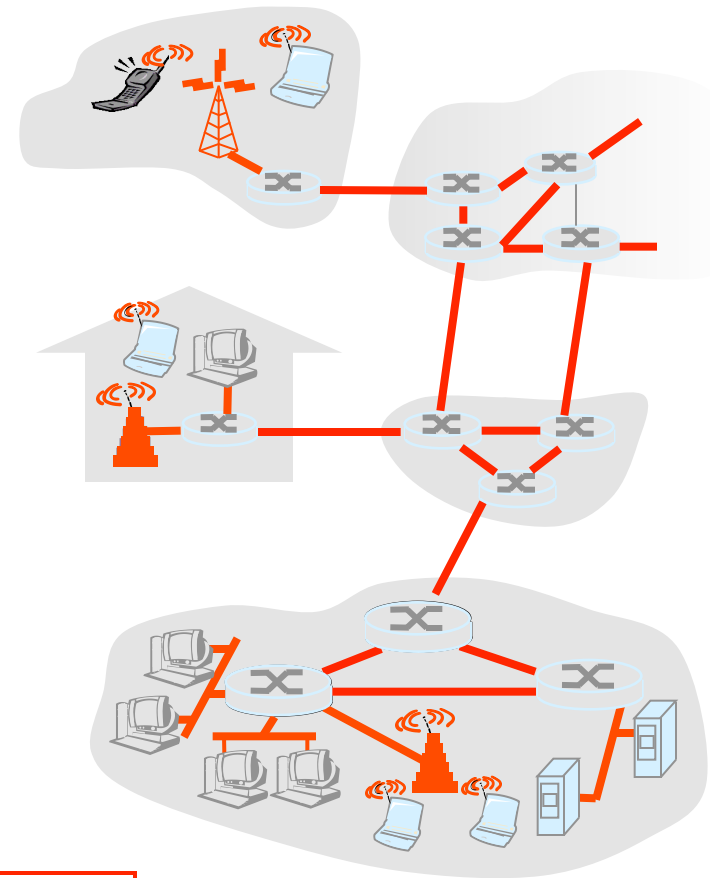

- ❑ Introduction and services
- ❑ Multiple access protocols
- ❑ Link-layer Addressing
- ❑ Ethernet
- ❑ Link-layer switches
- ❑ Link virtualization

Link Layer: Introduction

Some terminology:

- ❑ hosts and routers are **nodes**
- ❑ communication channels that connect adjacent nodes along communication path are **links**
 - wired links
 - wireless links
 - LANs
- ❑ layer-2 packet is a **frame**, encapsulates datagram

data-link layer has responsibility of transferring datagram from one node to adjacent node over a link

Link layer: context

- datagram transferred by different link protocols over different links:
 - e.g., Ethernet on first link, frame relay on intermediate links, 802.11 on last link
- each link protocol provides different services
 - e.g., may or may not provide reliable data transmission over link

transportation analogy

- trip from town A to town B
 - taxi: city center to airport A
 - plane: airport A to airport B
 - train: airport B to city center
- tourist = **datagram**
- transport segment = **communication link**
- transportation mode = **link layer protocol**
- travel agent = **routing algorithm**

Link Layer Services

❑ framing, link access:

- encapsulate datagram into frame, adding header, trailer
- channel access if shared medium
- “MAC” addresses used in frame headers to identify source and destination node
 - different from IP address!

❑ reliable delivery between adjacent nodes

- seldom used on low bit-error link (fiber, some twisted pair)
- wireless links: high error rates
 - Q: why both link-level and end-end reliability?

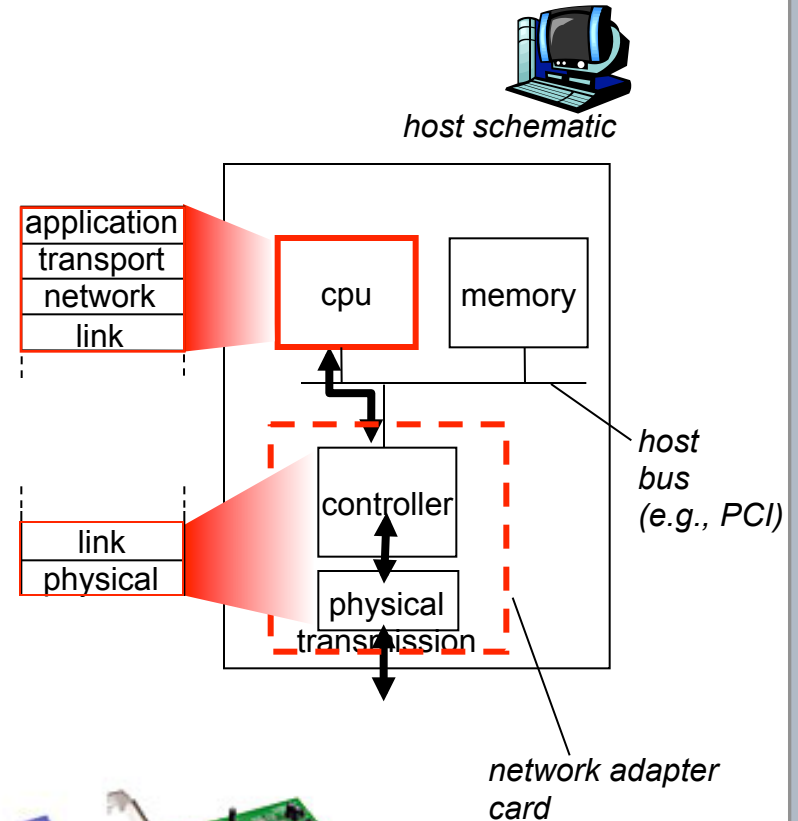

Link Layer Services (more)

- ❑ *flow control:*
 - pacing between adjacent sending and receiving nodes
- ❑ *error detection:*
 - errors caused by signal attenuation, noise
 - receiver detects presence of errors:
 - signals sender for retransmission or drops frame
- ❑ *error correction:*
 - receiver identifies *and corrects* bit error(s) without resorting to retransmission
- ❑ *half-duplex and full-duplex*
 - with half duplex, nodes at both ends of link can transmit, but not at same time

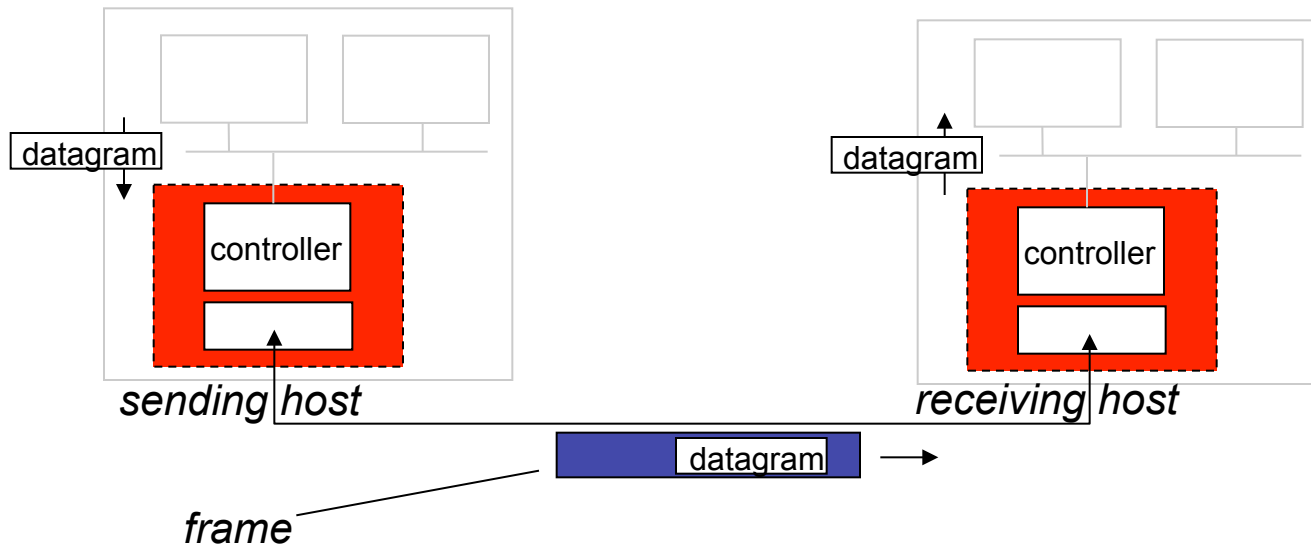

Where is the link layer implemented?

- in each and every host
- link layer implemented in “adaptor” (aka *network interface card* NIC)
 - Ethernet card, 802.11 card
 - implements link layer and physical layer
- attaches into host's system buses
- combination of hardware, software, firmware

Adaptors Communicating

□ sending side:

- encapsulates datagram in frame
- adds error checking bits, flow control, etc.

□ receiving side

- looks for errors, flow control, etc.
- extracts datagram, passes to upper layer at receiving side
